I was first introduced to the world of academic service by sitting in on the "business meeting" at NAACL 2018—the first conference I presented at. The program chairs of the conference presented a large number of very dizzying stats: how many reviewers and chairs were required, what updates were made to the conference and review process, how much funding was obtained, how much was used, and what decisions needed to be made behind the scenes. I remember thinking that this was fascinating[1] and couldn't wait to be involved. I was told by countless advisors and collaborators (as an undergrad and an early PhD student) that reviewing and chairing would very quickly get very tedious, but I was undeterred. Shortly after, as a PhD student, I started to review for any NLP and ML conferences that I was eligible for, and I now regularly serve as either Area Chair or Senior Area Chair for select conferences. I still find the process interesting: I view academic service as an integral part of the research process, and I'm excited to continue contribution to the communities that I do research in. I'm also excited to extend this service to more academic settings in the form of departmental or university service, or outreach programs.

1 Professional Service and Research Community Leadership

Chairing & Reviewing for Conferences

I have served in leadership roles for major conferences in NLP and machine learning, including as a Senior Area Chair for ACL, EMNLP, NAACL, and ICLR, and as an Area Chair for NeurIPS, ACL, EMNLP, NAACL, and ICLR. These roles have given me an appreciation for the challenges of evaluating research fairly and constructively across a rapidly evolving field. In particular, serving as an Area Chair and Senior Area Chair requires synthesizing competing technical assessments, identifying substantive methodological concerns, and helping reviewers and authors engage productively with one another.

I have also reviewed for leading journals, including *Computational Linguistics*, *Transactions of the Association for Computational Linguistics*, *Transactions on Machine Learning Research*, and the *Journal of Machine Learning Research*, as well as conferences spanning machine learning, NLP, fairness, and human–computer interaction. This breadth reflects my commitment to supporting rigorous scholarship across disciplinary boundaries. [Insert a specific example of improving a review process, resolving a difficult reviewer disagreement, or mentoring newer reviewers, if applicable.]

Tutorials and research dissemination

I believe an important form of academic service is making new technical ideas accessible to researchers who may not already work in a particular area. In 2023, I contributed to a tutorial on language models and vision at ACL, helping disseminate developments at the intersection of NLP and multimodal learning. I have also delivered lectures and presentations on AI safety, language grounding, and multi-agent decision-making to academic audiences, including at Brown University, UC Berkeley, and summer schools.

Educational Outreach and Broadening Participation

I believe that research communities benefit when students and researchers with different disciplinary backgrounds can participate meaningfully in technical discussions. Through lectures at the M2L Summer School on AI safety and the ethics of language models, I have had opportunities to introduce emerging AI research questions to students and early-career researchers. These activities are particularly rewarding because they allow participants to engage with frontier research before they have developed specialized expertise in the field.

My experience mentoring research interns at Google DeepMind has similarly shaped my commitment to supporting early-career researchers. I have helped students develop research questions, navigate experimental uncertainty, and communicate their findings through first-author publications. Although research mentoring is primarily a teaching responsibility, I also see it as part of the broader academic commitment to developing the next generation of

[1] It is worth noting that I was only an undergraduate, and had not yet started to even review for this conference. Part of the appeal was probably influenced by me being young, inspired by research, and unaware of how tedious academic service could truly get. That said, I still try to sit in on business meetings when I do have the time, at least for the NLP conferences!

researchers.

[Add one concrete example of outreach, supporting students from nontraditional backgrounds, community organizing, or an initiative that expanded access to research opportunities. Omit this paragraph if no such experience is applicable.]

BrownNLP Lab Organizing

During my PhD, I helped organize the ”Super Lab” seminar series: a cross-lab initiative to have people present research to the department on a bi-weekly basis. This was attended by up to 30 students, faculty or visitors, and

Future

As a faculty member, I look forward to contributing to the intellectual and organizational life of my department. I would be particularly interested in serving on graduate admissions and recruitment committees, helping organize seminar series and interdisciplinary research workshops, and contributing to initiatives that strengthen research mentoring and professional development. I'm also excited to have events that span across disciplines: my lab will have reading groups, seminar series, and collaborative events connecting language technologies and AI safety, while also engaging researchers in the social sciences and humanities who study the human implications of AI systems. I also hope to contribute to the development of responsible research practices within academic AI laboratories, particularly around evaluation rigor, research transparency, and mentoring. Through these efforts, I aim to help build a department in which students and faculty can pursue ambitious research while contributing to a supportive and intellectually engaged community. Ultimately, I view service not as separate from research and teaching, but as part of the infrastructure that makes both possible. I look forward to continuing my contributions to the NLP and machine learning communities while taking on the new responsibilities of departmental and university service as a faculty member.
